                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               80
                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                    The invention relates to novel inositol polyphosphate kinase (IPPK) polypeptides and polymucleotides. Sequences of the invention are useful in modulating the phytic acid biosynthesis by decreasing phytate and/ or increasing non-phytate phosphorous to improve the nutritional value of animal feed, or to reduce the environmental impact of animal waste. Polymucleotides of the invention are to produce transpance plants with a altered phenotype. IPPK proteins are used to screen compounds that modulate their activity and raising anti-idiotypic antibodies. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              80
        ö
in modulating the phytic acid biosynthesis by decreasing phytate and/ or increasing non-phytate phosphorous to improve the nutritional value of animal feed, or to reduce the environmental impact of animal waste. Polymucleotides of the invention are to produce transgenic plants with altered phenotype. IPPK proteins are used to screen compounds that modulate their activity and raising anti-idiotypic antibodies. The present sequence is maize IPPK DNA
                                                                                                                                                                                                                                                                                                                                          MetSerappLeulisProProGludisGlnValalaGlyHisArgAlaSerAlaSerLys

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel inositol polyphosphate kinase (IPPK) polypeptides and polynuclectides. Sequences of the invention are useful in modulating the phytic acid biosynthesis by decreasing phytate and/ or increasing non-phytate phosphorous to improve the nutritional value of animal feed, or to reduce the environmental impact of animal waste. Polynucleotides of the invention are to produce transgenic plants with an altered phenotype. IPPK proteins are used to screen compounds that modulate their activity and raising anti-idiotypic antibodies. The

The invention relates to novel inositol polyphosphate kinase (IPPK) polypeptides and polynucleotides. Sequences of the invention are useful in modulating the phytic acid biosynthesis by decreasing phytate and/ or increasing non-phytate phosphorous to improve the nutritional value of animal feed, or to reduce the environmental impact of animal waste. Polynucleotides of the invention are to produce transgenic plants with an altered phenotype. IPPK proteins are used to screen compounds that modulate their activity and radising anti-idiotypic antibodies. The present sequence is P. argentatum IPPK DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            4 LeuHisProProGluHisGlnValAlaGlyHisArgAlaSerAlaSerLygLeuGlyPro

Sequences of the invention are useful in medulating the phytic acid biosynthesis by decreasing phytate and/or increasing non-phytate phosphorous to improve the nutritional value of animal feed, or to reduce the environmental impact of animal waste. Bolynucleotides of the invention are to produce transgenic plants with an altered phenotype. IPPK proteins are used to screen compounds that modulate their activity and raising anti-idiotypic antibodies. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel inositol polyphosphate kinase (IPPK) polypeptides and polymucleotides. Sequences of the invention are useful in medulating the phytic acid biosynthesis by decreasing phytate and/ or increasing non-phytate phosphorous to improve the mutritional value of animal feed, or to reduce the environmental impact of animal waste. Polymucleotides of the invention are to produce transgenic plants with a altered phenotype. IPPK proteins are used to screen compounds that modulate their activity and raising anti-idiotypic antibodies. The present sequence is Eucalyptus grandis IPPK DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                94
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GluvalAlaPheTyrGluAlaPheSerAlaHisAlaAlaValProAlaArgIleArgAsp

The invention relates to novel inositol polyphosphate kinase (IPPK) polypeptides and polymucleotides. Sequences of the invention are useful in modulating the phytic acid biosynthesis by decreasing phytate and/ or increasing non-phytate phosphorous to improve the nutritional value of animal feed, or to reduce the environmental impact of animal waste. Polynucleotides of the invention are to produce transgenic plants with an altered phenotype. IPPK proteins are used to screen compounds that modulate their activity and raising anti-idiotypic antibodies. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              56
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          83

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                      1521

On Jun 28, 2004 this sequence version replaced gi:34740257.

Genes were predicted from the integrated results of the following: GENSCAN (http://ccm.oll.mit.edu/GENSCAN.html), FGENESH (http://ccm.oll.ology.gatech.old/Senskark), Glimmerh (http://cpm.olology.gatech.old/Senskark), Glimmerh (http://cpm.olology.gatech.old/Senskark), Glimmerh (http://cpm.olology.gatech.old/Senskark), SplicePredictor (http://www.tigr.org/db/glimmerm/glmr.form.html), RiceHWM (http://ycpm.olology.gatech.old/Senskark), SplicePredictor (http://ycpm.olology.gatech.old/Senskark), SplicePredictor (http://ycpm.olology.gatech.old/Senskark), SplicePredictor (http://ycpm.olology.gatech.old/Senskark), SplicePredictor (http://ycpm.olology.gatech.ology.plm.fcm.html), gap2 (http://www.tigr.org/software/glimmerm/) BanSYN and Electrican flow ology (http://www.tigr.org/software/glimmerm/) BanSYN and the coloning captoner was searched against NCBI NonRedundant Protein database with BanSYP. ESTS represent the identified cDNA sequences using BanSYN with the corresponding DBJ accession no. and RGP clone ID. Phil-length CDNAs represent the identified cDNA sequences using BanSYN with the corresponding DBJ accession no.

A gene with BanSYP ESTS represent the identified cDNA sequences using BanSYN with the corresponding DBJ accession no.

A gene with Admity or significant homology to a protein is classified based on the protein but with full-length of garrial such as same name, 'purcein and 'like protein', A gene predicted by capy protein but with full-length of any protein but with full-length of any protein but with full-length of any protein according to IRGSP standard. A gene predicted by a single gene prediction program is also classified as an 'hypochetical' protein accessio

The genomic sequence was searched against NCBI NonRedundant Protein database at RGP or DDBJ. Protein homologies of the coding regions were searched against NCBI NonRedundant Protein database with BLASTR. Estr represent the identified cDNA sequences using BLASTN with the corresponding DDBJ accession no. and RGP clone ID. Full:hength cDNAs represent the identified cDNA sequences using BLASTN with the corresponding DDBJ accession no. and RGP clone ID. Full:hength cDNAs represent the identified cDNA sequences using BLASTN with the corresponding DDBJ accession no. and RGP clone ID. Full:hength cDNAs represent the identified cDNA sequences using BLASTN with the corresponding DDBJ accession no. and RGP clone ID. Full:hength cDNAs represent the identified cDNA sequences using BLASTN with the corresponding DDBJ accession no. and RGP clone ID. Full:hength cDNAs represent the identified cDNA sequences using Sunstfied based on the protesin name to indicate the homology to approach significant homology to any protein but with full-length cDNAs represent the entire EST homology (covering almost the entire length of partial sequence) is classified as an 'unknown' protein. A gene predicted by a single gene prediction program is also classified as a miscellaneous feature of the sequence is from the protein and is included by a single 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The orientation of the sequence is from SP6 to T7 of the PAC clone. This sequence of P0415B12 clone has an overlap with OSJNBa0047A17 clone (DDBJ: AP005749) at 5' end and an overlap with P045BB05 (DDBJ: AP004777) at 3' end. Detailed information on overlap and assembly quality together with annotation of this entry is available at http://rgp.dna.affrc.go.jp/GenomeSeq.html.
